

How the project works

Build tools, site workflow, and the current browser-only ticket queue.

01 BUILD AND DELIVER

Supporting tool: Git + GitHub keeps source history and backups - not live ticket records.

02 ASK, ANSWER, OR CREATE A TICKET

Existing alternatives: Node.js / JavaScript with private local files; optional PHP server storage (Ocelot writes remain blocked). These are alternative modes, not extra layers required by Supabase.

Shared data with Supabase

Owner-created project: <https://mkpkjmqjbfhkazxgpggg.supabase.co>

03 PROPOSED CONNECTIONS (DASHED)

Before connection: replace the demo identity with verified access; keep internal notes staff-only. Never put privileged keys in browser code. **Shared storage is not a backup:** export the database and back up attachment files separately.

04 WHICH LANGUAGE DOES EACH PART USE?

LANGUAGE / TECHNOLOGY	WHAT IT DOES	PROJECT STATUS
HTML + CSS	Page structure and visual styling	Current
JavaScript	Chat, forms, queue; Node.js runs JS tools/backend	Current
JSON / IndexedDB	Data format / browser database - not languages	Current demo
PHP	Optional shared server-file backend	Built; host blocked
SQL + PostgreSQL	Supabase database tables, queries and policies [1]	Hosted setup pending
JavaScript client	Website-to-Supabase API connection [2]	Built; not activated
TypeScript	Optional Supabase Edge Functions [3]	Optional future

[1] Supabase: Database / SQL

Security: database policies

[2] JavaScript client

Private file storage

[3] TypeScript Edge Functions

Database and file backup limits
